In this Issue:

- * Inventories
- * Sows Farrowing
- * Pig Crop

Revisions for 1978 and 1979:

- * Inventory, December 1 and March 1
- * Sows Farrowing and Pig Crop, December-February

INVENTORY 18 PERCENT HIGHER: Inventory of hogs and pigs on June 1, 1979 in the U.S. was estimated at 64.9 million head, 18 percent above last year, 19 percent larger than 1977 and the largest June inventory since 1971, according to the Crop Reporting Board.

-- Breeding inventory, at 10.4 million head, was 17 percent higher than a year ago and 19 percent above two years earlier.

-- Market hog inventory, at 54.5 million head, was 18 percent larger than 1978 and 19 percent greater than 1977.

The 14 Quarterly States estimate was 86 percent of the U.S. total inventory. These States, with 55.5 million head, were 18 percent above last year and 19 percent higher than two years ago.

PIG CROP (DECEMBER 1978-MAY 1979): The December 1978-May 1979 U.S. pig crop was 50.6 million head, a 19 percent increase from last year and 18 percent more than two years ago.

Sows farrowed during this 6-month period, 7.18 million, were 19 percent more than those farrowed last year. Pigs saved per litter at 7.05 were about the same as last year's low level.

In the 14 Quarterly States, the December-May pig crop was 43.3 million head, 19 percent above last year. The December-February pig crop at 18.3 million head was 17 percent greater than last year and the March-May total, at 25.0 million head, was up 21 percent.

FARROWING INTENTIONS: U.S. producers intend to farrow 7.42 million sows during the June-November period, an increase of 16 percent from the same period in 1978 and 23 percent above 1977.

Intentions in the 14 Quarterly States for June-August are 3.11 million sows, up 17 percent from the corresponding period in 1978, but down 2 percent from the March 1, 1979 intentions. For the September-November quarter, these States intend to farrow 3.19 million sows, 14 percent more than the comparable quarter in 1978.

U.S. HOG AND PIG INVENTORY

JUNE 1, 1969-1979

RELIABILITY AND ESTIMATING PROCEDURES: Primary data used in setting these hog estimates were collected from a sample of farmers across the U.S. using probability surveys. Information was collected by mail, telephone and personal interviews. Since all farmers raising hogs were not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about two percent at the U.S. level for hog inventory. This means that chances are approximately 95 out of 100 that survey estimates will be within four percent of the complete coverage value if the same procedures were used to survey all procedures. Survey estimates are also subject to non-sampling errors such as omissions, duplications, and mistakes in reporting, recording and processing the data. These errors cannot be measured directly, but they are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

The sampling variability of survey estimates on intended farrowings is slightly larger than that for inventories. More important, actual farrowings may differ significantly from reported intentions due to unexpected economic and environmental conditions. These differences have exceeded four percent for about one-third of the quarterly pig crops during the last five years.

In setting the inventory estimates, the Crop Reporting Board constructed a U.S. balance sheet using estimates on births, deaths and check data on slaughter, imports and exports. This balance sheet provided an additional check on survey inventory estimates.

APPROVED:
